

Chapter 9 Day 4:

Today you will learn how to rewrite a quadratic in Vertex Form. This process is known as completing the square.

First I will take you through a problem, then I will give you the steps. This way the steps will make more sense:)

Example: Write this equation in Vertex Form using Completing the Square.

$$y = x^2 - 16x + 15$$

$$y = x^2 - 16x + \frac{64}{1} + 15 - \frac{64}{1}$$

$$y = (x - 8)^2 - 49$$

Steps to follow:

1. Factor out a GCF
2. Rewrite the problem placing a +____ and -____ in the appropriate places.
3. Below this line begin to write a ()²
4. Now fill the parenthesis with the letter used in the problem and 1/2 of the b term.
5. Now square the number that you just found and write it in the blanks above.
6. Combine the last two numbers and write them after your ()²

Example: Write this equation in Vertex Form using Completing the Square.

$$y = n^2 - 6n - 72$$

$$y = n^2 - 6n + \frac{9}{1} - 72 - \frac{9}{1}$$

$$y = (n - 3)^2 - 81$$

Example: Write this equation in Vertex Form using Completing the Square.

$$f(x) = x^2 - 7x + 1$$

$$f(x) = x^2 - 7x + \frac{49}{4} + 1 - \frac{49}{4}$$

$$f(x) = \left(x - \frac{7}{2}\right)^2 + -\frac{45}{4}$$

$$\frac{49}{4} - \frac{49}{4}$$

Example: Write this equation in Vertex Form using Completing the Square.

$$f(z) = z^2 + 11z + \frac{21}{4}$$

$$f(z) = z^2 + 11z + \frac{121}{4} + \frac{21}{4} - \frac{121}{4}$$

$$f(z) = \left(z + \frac{11}{2}\right)^2 - 25$$

Example: Change $f(x)$ from Vertex Form into Standard Form.

$$f(x) = 3(x-5)^2 - 72$$

$$\begin{aligned} f(x) &= 3(x^2 - 10x + 25) - 72 \\ f(x) &= 3x^2 - 30x + 75 - 72 \\ f(x) &= 3x^2 - 30x + 3 \end{aligned}$$
