3-DIMENSIONAL PROBLEM SOLVING

We can use Pythagoras' theorem and trigonometry to find unknown angles and lengths in 3-dimensional figures.

A rectangular prism has the dimensions shown alongside. Find the angle between the diagonal AB and the edge BC.

Consider the end of the prism containing A and C. Let AC be x cm.

By Pythagoras, $x^2 = 6^2 + 11^2$
 $\therefore x^2 = 157$
 $\therefore x = \sqrt{157}$

The points A, B, and C form a triangle which is right angled at \widehat{BCA} .

$$\tan \theta = \frac{\text{OPP}}{\text{ADJ}} = \frac{\sqrt{157}}{14}$$

$$\therefore \theta = \tan^{-1} \left(\frac{\sqrt{157}}{14} \right)$$

$$\therefore \theta \approx 41.8^\circ$$

So, the required angle is 41.8° .

- 1 The cube shown has sides of length 13 cm. Find:
- BD
 - the angle FDB.

2

In the rectangular prism shown, Z is the midpoint of XW. Find:

- VX
- the angle RXV
- YZ
- the angle YZU.
