

Quiz Review 6.1 to 6.4 B

Algebra 1

Name: _____

Period: _____ Date: _____

Complete problems 1 and 2 using Desmos:

1. Solve the following systems of equations:

$$\begin{aligned} a) \quad -2x &= -16 - 2y \\ 3x - 6y &= 30 \end{aligned}$$

$$(6, -2)$$

$$\begin{aligned} b) \quad 15x - 5y &= 20 \\ 6x - 2y &= -8 \end{aligned}$$

$$\text{SOLN. } \begin{array}{l} \cancel{15x - 5y = 20} \\ \cancel{6x - 2y = -8} \end{array}$$

2. What is the sum of the x & y values in the solution to the system:

$$\begin{aligned} 3x - 2y &= -5 \\ 4x + 5y &= 47 \end{aligned}$$

$$\begin{pmatrix} 3 \\ 7 \\ 10 \end{pmatrix}$$

3. Solve the following systems of equations using substitution:

$$\begin{aligned} a) \quad -5x + 3y &= 51 \\ y &= 10x - 8 \end{aligned}$$

$$\begin{aligned} -5x + 3(10x - 8) &= 51 \\ -5x + 30x - 24 &= 51 \\ 25x - 24 &= 51 \\ 25x &= 75 \\ x &= 3 \end{aligned}$$

$$\begin{aligned} b) \quad 4.5x + 1.5y &= 24 \\ x - y &= 4 \end{aligned}$$

$$\begin{aligned} 4.5(4+y) + 1.5y &= 24 \\ 18 + 4.5y + 1.5y &= 24 \\ 18 + 6y &= 24 \\ 6y &= 6 \\ y &= 1 \end{aligned}$$

$$\begin{aligned} c) \quad x - 2y &= 7 \\ -x + 2y &= 7 \\ -(7+2y) + 2y &= 7 \\ -7 - 2y + 2y &= 7 \\ -7 &= 7 \end{aligned}$$

No Solution

4. Solve the following systems of equations using elimination:

$$\begin{aligned} a) \quad 2x &= 32 + y \\ y - 5x &= 13 \end{aligned}$$

$$\begin{aligned} 2x - y &= 32 \\ -5x + y &= 13 \\ \hline -3x &= 45 \\ -3 &= -3 \end{aligned}$$

$$x = -15$$

$$(-15, -62)$$

$$2(-15) = 32 + y$$

$$\begin{aligned} -30 &= 32 + y \\ -32 - 32 &= -30 \end{aligned}$$

$$y = -62$$

$$b) \quad \begin{aligned} 7x + 2y &= 8 \\ 4x + 3y &= -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$\begin{aligned} (1) &\quad 7x + 2y = 8 \\ (2) &\quad 4x + 3y = -1 \end{aligned}$$

$$(2, -3)$$

5. For what value of k will the given system have infinitely many solutions?

$$\begin{array}{l} 6x + 9y = -12 \\ 2x + ky = -4 \end{array} \quad \left| \begin{array}{l} \text{3} \\ \text{3} \end{array} \right. \quad \left| \begin{array}{l} \text{3} \\ \text{3} \end{array} \right.$$

$$\frac{k \cdot 3}{3} = \frac{9}{3}$$

$$K = 3$$

equations
must be same
or multiples
of each other.

6. A website allows users to download individual songs or an entire album.
All songs cost the same and all albums cost the same. Anthony pays \$14.94 for 5 songs and 1 album. Taylor pays \$22.95 for 3 songs and 2 albums.

a) Write a system of equations to describe this situation.

$$\begin{array}{l} \Leftrightarrow 5s + 1a = 14.94 \quad (1) \\ \quad 3s + 2a = 22.95 \end{array} \quad \begin{array}{l} 5(9.99) + a = 14.94 \\ -4.95 + a = 14.94 \\ \hline a = 9.99 \end{array}$$

b) How much does it cost for each song and each album?

$$\begin{array}{r} -10s - 2a = 29.88 \\ 3s + 2a = 22.95 \\ \hline -7s = -6.93 \end{array} \quad \begin{array}{l} s = \frac{99}{994} \\ \text{Song} = 9.99 \\ \text{Album} = \$9.99 \end{array}$$

c) How much would 19 songs and 3 albums cost to download?

$$19(.99) + 3(9.99)$$
 ~~$18.81 + 29.97 = \$48.78$~~

7. Nick has 82 coins in his piggy bank. All are quarters and dimes. Their total value is \$11.65

a) Write a system of equations to describe this situation.

$$\begin{array}{l} Q + d = 82 \\ .25Q + .10d = 11.65 \end{array} \quad \begin{array}{l} Q = 82 - d \\ \checkmark \end{array}$$

b) How many of each type of coin does he have?

$$\begin{array}{l} .25(82-d) + .10d = 11.65 \\ 20.5 - .25d + .10d = 11.65 \end{array}$$

$$\begin{array}{r} 20.5 - .15d = 11.65 \\ -20.5 \quad -20.5 \\ \hline -.15d = -8.85 \end{array}$$

$$\begin{array}{l} d = 59 \text{ dimes} \\ Q = 82 - d = 82 - 59 = 23 \text{ quarters} \end{array}$$
