

How many black circles do you see?

Geometry

"geometria" is _____

combo of geo (earth)
and metria (measure)

study of shapes and sizes of objects and figures

Graph each inequality.

1. $x \leq 1$

2. $-2 \leq x \leq 3$

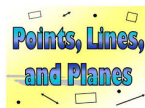

3. Juan has more than 5 but fewer than 11 fish in his aquarium.
Write an inequality to express the number of fish f Juan has.

**Chapter 1****Essentials of Geometry**

1.3 Use Midpoint and Distance Formulas

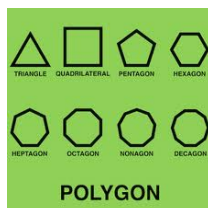

1.1 Identify Points, Lines, and Planes

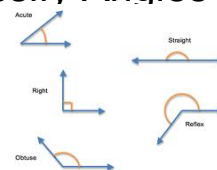

1.5 Use Special Angle Relationships to Find Angle Measures

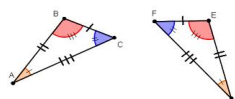

1.6 Classify Polygons

1.4 Measure and Classify Angles

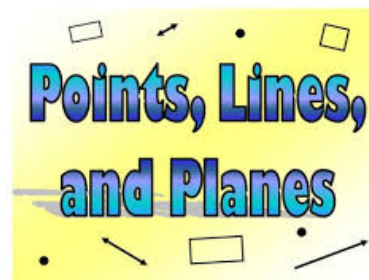

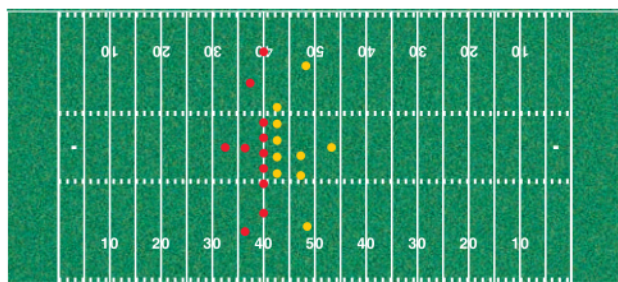

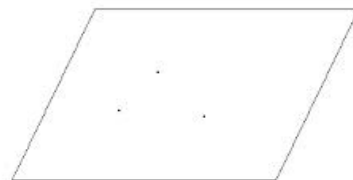

1.2 Use Segments and Congruence

1.1 Identify Points, Lines, and Planes

Goal: Name and sketch geometric figures

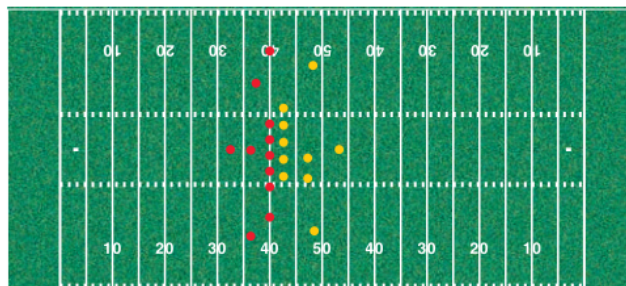

Undefined Terms - words that do not have a formal definition, but there is agreement about what the words mean

(Point, Line, and Plane)

(very much like a, an, and, or, if, the, of, then... in English)

In the diagram of a football field, the positions of players are represented by *points*. The yard lines suggest *lines*, and the flat surface of the playing field can be thought of as a *plane*.

Undefined Terms

Point - a point has no dimension
it is represented by a dot

point A (0-d)

Line - a line has one dimension
- represented by a line with 2
arrowheads, extends without end
ex) number line, string, rope, pencil

line ℓ , line AB (\overleftrightarrow{AB}),
or line BA (\overleftrightarrow{BA}) (1-d)

Plane - a plane has 2 dimensions
- represented by a shape that
looks like a wall or floor,
extends without end
ex) desk top, tennis court, paper

Plane M Plane ABC (2-d)
plane M or plane ABC
flat surface

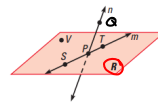

* through any 3 points not on the same line, there is exactly one plane

Collinear points - points that lie on the same line

Coplanar points - points that lie on the same plane

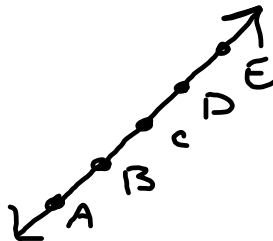

Name points, lines, and planes

- a. Give two other names for \overleftrightarrow{PQ} and for plane R.
b. Name three points that are collinear.
Name four points that are coplanar.

a) line n plane TVS
 \overleftrightarrow{QP} USP
b) SPT
VTQS

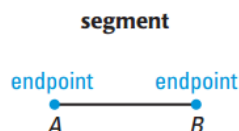

Line \overleftrightarrow{AB}

line
 \overleftrightarrow{AC} \overleftrightarrow{BE} \overleftrightarrow{DB} \overleftrightarrow{EA}
 \overleftrightarrow{CD} $\overleftrightarrow{AB} = \overleftrightarrow{BA}$

Segment or (Line Segment) - consists of 2 endpoints and all points between those endpoints

Segment \overline{AB}

\overline{AB} \overline{DB} \overline{AE} \overline{EC}
 \overline{CD} $\overline{BE} = \overline{EB}$

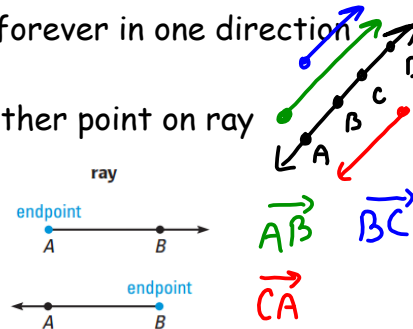

Ray - consists of an endpoint and all points on a line extending in just one direction

- like a laser beam, continues forever in one direction

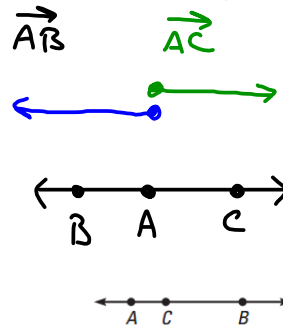

- named by endpoint and any other point on ray

Ray \overrightarrow{AB}

$$\overrightarrow{CA} \neq \overrightarrow{AC}$$

Opposite Rays - 2 rays that share and form a straight line

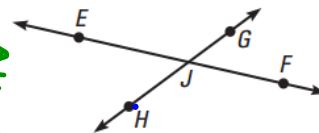

\overrightarrow{AB} and \overrightarrow{AC} are
opposite rays iff
A is between B and C

Name segments, rays, and opposite rays

1. a. Give another name for \overline{GH} . \overline{HG}

b. Name all rays with endpoint J. Which of these rays are opposite rays?

\overrightarrow{JE} \overrightarrow{JF}
 \overrightarrow{JG} \overrightarrow{JH}

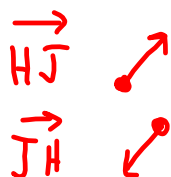

2. Give another name for \overline{EF} . \overline{FE}

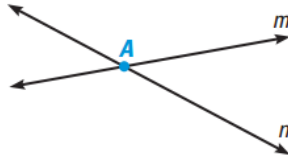

3. Are \overrightarrow{HJ} and \overrightarrow{JH} the same ray? Are \overrightarrow{HJ} and \overrightarrow{HG} the same ray? Explain.

No - different fixed
endpoints

Yes - J and G lie on
same side of H

Intersection - the point or points that 2 or more figures have in common

point A is the intersection of line m and line n

\overleftrightarrow{AB}

line

\overline{AB}

segment

\overrightarrow{AB}

ray

AB

distance just a # (length)

A

point

HW: Pg 5 #'s 1-22, 26, 27, 29, 31 , 33-38, 43
